So What Exactly Is Chrome OS?

So computers have been around since forever right? The web and computers is just something weve all grown up using. We have all adapted to this technology and we all use it everyday. When you look at your computer and I mean really look at it and what you use it for Ill bet the majority of what you use it for is to access the web. According to statistics over 90% of all computer use is to access the net. So what do you think of when you think Internet? well most people think Google, in fact there are some non IT type people who would actually struggle to tell you the difference between Google and the Internet.

FireFox and Internet Explorer were both challenged two years ago when Google launched their own browser Google Chrome. Then in the middle of 2009 Google announced they werent content with just being a search engine and a browser they decided they wanted to be an operating system too. Microsofts Office products were given a run for their money back in 2007 when Google launched their Google Docs. It will come as no shock that this new operating system will be totally cloud centric and use [cloud storage rather than a physical hard drive. This has many benefits including getting rid of the need for a data centers which does have to potential to save massive amounts of money.](#)

Now we have to ask why are Google using this [virtualization technology as the focal point of their operating system? Well for starters theyre playing to their strengths: no one knows the internet like Google does. The main reason they claim to have come up with this operating system is because they know that we dont really need to use so much of the other stuff the clogs out computers up so it makes sense to get rid of everything thats unnecessarily slowing our computers down.](#)
